# MBatch 04-04 Using MBatch Assessments: Boxplot\_Group\_Structures Tod Casasent 2017-11-02-0905

#### 1 Introduction

These instructions are aimed at people familiar with R and familiar with TCGA/GDC platforms and data types. They are intended to introduce the reader to producing the given assessment. These instructions will only rarely, if ever, touch on the appropriateness of the assessment algorithm or interpretation of output. See MBatch\_01\_InstallLinux.docx for instructions on downloading test data.

# 2 Algorithm

Boxplot\_Group\_Structures is a function used to perform batch effects assessments using the boxplots and violin plots algorithms. Assessment is performed on each batch type available by default.

# 3 Output

The primary output method for MBatch is to view results in the Batch Effects Website, described elsewhere. The PNG files are rough versions of the website output.

Graphical output is a set of boxplots, one for each batch, based in this case on the mean for each sample.

#### 4 Usage

Boxplot\_Group\_Structures(theData, theTitle, theOutputPath, theBatchTypeAndValuePairsToRemove, theBatchTypeAndValuePairsToKeep, theListOfGroupBoxFunction, theListOfGroupBoxLabels, theMaxGeneCount=20000, theJavaParameters = "-Xms8000m")

# 5 Arguments

**theData** An instance of BEA\_DATA BEA\_DATA-class. This is the MBatch Data Object (of class BEA\_DATA) described in MBatch\_03\_UserData.docx, and returned from mbatchLoadFiles or mbatchLoadStructures.

**theTitle** Object of class "character". Title to use in PNG files.

**theOutputPath** Object of class "character". Directory in which to place output PNG files and related data files used by the Batch Effects Website.

**theBatchTypeAndValuePairsToRemove** Object of class "list". A list of vectors containing the batch type (or \* for all types) and the value to remove. list() or NULL indicate do nothing. This type of list is described in MBatch\_03\_ParametersBatchTypesValues.docx.

**theBatchTypeAndValuePairsToKeep** Object of class "list". A list of vectors containing the batch type (or \* for all types) and a vector of the value(s) to keep. list() or NULL indicate do nothing. This type of list is described in MBatch 03 ParametersBatchTypesValues.docx.

**theListOfGroupBoxFunction** Object of class "vector" A list of functions to use for group assessments. This is a legacy argument. Always send this an argument of "c(mean)". The length must match the length for theListOfGroupBoxLabels. A future version will replace this argument with an alternative method of selecting group functions other than mean.

**theListOfGroupBoxLabels** Object of class "vector" A list of strings giving strings for labels to use for group assessments. This is a legacy argument. Always send this an argument of "c("Mean")". The length must match the length for theListOfGroupBoxFunction. A future version will replace this argument with an alternative method of selecting group functions other than mean.

**theMaxGeneCount** Integer giving maximum number of features (genes) to keep. Default is 20000. 0 means keep all.

**theJavaParameters** Object of class "character" String for initializing JVM. Defaults to -Xms8000m.

# 6 Example Call

The following code performs Boxplots and is taken from the tests/Boxplot\_Group\_Structures.R file. Data used is from the testing data as per the MBatch\_01\_InstallLinux.docx document.

```
library(MBatch)
# set the paths
theGeneFile <- "/bea testing/MATRIX DATA/matrix data-Tumor.tsv"
theBatchFile <- "/bea testing/MATRIX DATA/batches-Tumor.tsv"
theOutputDir <- "/bea_testing/output/Boxplot_Group_Structures"
# make sure the output dir exists and is empty
 unlink(theOutputDir, recursive=TRUE)
 dir.create(theOutputDir, showWarnings=FALSE, recursive=TRUE)
# load the data and reduce the amount of data to reduce run time
 mvData <- mbatchLoadFiles(theGeneFile, theBatchFile)</pre>
 myData@mData <- mbatchTrimData(myData@mData, 100000)
 # here, we take most defaults
 Boxplot_Group_Structures(theData=myData,
               theTitle="Test",
               theOutputPath=theOutputDir,
               theBatchTypeAndValuePairsToRemove=NULL,
               theBatchTypeAndValuePairsToKeep=NULL,
               theListOfGroupBoxFunction=c(mean),
               theListOfGroupBoxLabels=c("Mean"),
               theJavaParameters="-Xms8000m",
               theMaxGeneCount=10000)
```

# **6.1 Command Line Output**

In the future, we plan to make the output from MBatch more user friendly, but currently, this produces the following output at the command line.

```
> library(MBatch)
> # set the paths
> theGeneFile <- "/bea_testing/MATRIX_DATA/matrix_data-Tumor.tsv"
> theBatchFile <- "/bea_testing/MATRIX_DATA/batches-Tumor.tsv"
> theOutputDir <- "/bea_testing/output/Boxplot_Group_Structures"
> # make sure the output dir exists and is empty
> unlink(theOutputDir, recursive=TRUE)
> dir.create(theOutputDir, showWarnings=FALSE, recursive=TRUE)
```

```
> # load the data and reduce the amount of data to reduce run time
> myData <- mbatchLoadFiles(theGeneFile, theBatchFile)

# **6.2** Example File Output

The above code creates the following output files. Files are named using the following naming convention:

BoxPlot\_Group-MEAN\_Diagram-<BatchType>.png

BoxPlot\_Group-MEAN\_Legend-<BatchType>.png

The diagram file contains a Boxplot for all batch types (the columns from the batches.tsv file). The legends give the list of batches within the given batch type, and the colors used for each batch.

The Group-MEAN Boxplots plot the mean for each feature within a batch (genes or probes). So the vertical axis is based on the mean of the values of the original data and the points plotted are features. The actual meaning of the data used, such as expression, read counts, and the like, will vary based on the data being processed.

The annotation TSV files are used internally and contain the total number of data points and the number of non-NA points.

```
